- $\pi_1(X, x_0, y_0)$  has a groupoid structure.
- $\pi_1(X, x_0) := \pi_1(X, x_0, x_0)$  has a group structure.
- $X$  complex manifold  $\Rightarrow \gamma$  can be considered Piecewise Smooth.

## Definition

- $\pi_1(X, x_0, y_0) := \{\gamma \in \Gamma(X, x_0, y_0)\} / \sim$
- $\pi_1(X, x_0, y_0)$  has a groupoid structure.
- $\pi_1(X, x_0) := \pi_1(X, x_0, x_0)$  has a group structure.
- $X$  complex manifold  $\Rightarrow \gamma$  can be considered Piecewise Smooth.

## Definition

- $\pi_1(X, x_0, y_0) := \{\gamma \in \Gamma(X, x_0, y_0)\} / \sim$
- $\pi_1(X, x_0, y_0)$  has a groupoid structure.
- $\pi_1(X, x_0) := \pi_1(X, x_0, x_0)$  has a group structure.
- $X$  complex manifold  $\Rightarrow \gamma$  can be considered Piecewise Smooth.
- $X$  connected  $\Rightarrow \pi_1(X)$

Example

$$\pi_1(S^1) = \mathbb{Z}.$$

Example

$\pi_1(S^1) = \mathbb{Z}$ .

Example (Ordered Configuration Spaces)

Let  $X_n := \{(z_1, \dots, z_n) \in \mathbb{C}^n \mid z_i \neq z_j, i \neq j\}$ . Then  $\pi_1(X_n) = \mathbb{P}_n$ .

Example

$\pi_1(\mathbb{S}^1) = \mathbb{Z}$ .

Example (Ordered Configuration Spaces)

Let  $X_n := \{(z_1, \dots, z_n) \in \mathbb{C}^n \mid z_i \neq z_j, i \neq j\}$ . Then  $\pi_1(X_n) = \mathbb{P}_n$ .

Example (Non-ordered Configuration Spaces)

Let  $\mathcal{P}_n := \{f(z) \in \mathbb{C}[z] \mid \deg(f) = n\}$ ,  $Y_n := \mathbb{P}(\mathcal{P}_n \setminus \Delta_n)$ , where  $\Delta_n := \{f \in \mathcal{P}_n \mid f \text{ has multiple roots}\}$ . Note that  $Y_n \cong X_n/\Sigma_n$ . Then  $\pi_1(Y_n) = \mathbb{B}_n$ . Analogously, if we consider  $\tilde{\mathcal{P}}_n := \{f(s, t) \in \mathbb{C}[s, t] \mid f \text{ homogeneous } \deg(f) = n\}$ ,  $\tilde{Y}_n := \mathbb{P}(\tilde{\mathcal{P}}_n \setminus \tilde{\Delta}_n)$ , where  $\tilde{\Delta}_n := \{f \in \tilde{\mathcal{P}}_n \mid f \text{ has multiple roots}\}$ . Note that  $\pi_1(\tilde{Y}_n) = \mathbb{B}_n(\mathbb{S}^2)$ .

## Van Kampen Theorem

### Theorem

Let  $U_1$  and  $U_2$  open subsets of  $X$  such that:

- $U_1 \cup U_2 = X$  and
- $U_{12} := U_1 \cap U_2$  is path-connected.

Then

$$\pi_1(X) = \pi_1(U_1) *_{\pi_1(U_{12})} \pi_1(U_2).$$

## Van Kampen Theorem

### Theorem

Let  $U_1$  and  $U_2$  open subsets of  $X$  such that:

- $U_1 \cup U_2 = X$  and
- $U_{12} := U_1 \cap U_2$  is path-connected.

Then

$$\pi_1(X) = \pi_1(U_1) *_{\pi_1(U_{12})} \pi_1(U_2).$$

### Example

$$\pi_1(S^1 \vee \dots \vee S^1) = \mathbb{F}_n.$$

## Van Kampen Theorem

### Theorem

Let  $U_1$  and  $U_2$  open subsets of  $X$  such that:

- $U_1 \cup U_2 = X$  and
- $U_{12} := U_1 \cap U_2$  is path-connected.

Then

$$\pi_1(X) = \pi_1(U_1) *_{\pi_1(U_{12})} \pi_1(U_2).$$

### Example

$$\pi_1(S^1 \vee \dots \vee S^1) = \mathbb{F}_n.$$

### Example

Let  $z_1, \dots, z_n \in \mathbb{C}$ ,  $Z_n := \{z_1, \dots, z_n\}$ . Then  $\pi_1(\mathbb{C} \setminus Z_n) = \mathbb{F}_n$ .

## Locally trivial Fibrations

### Definition

A surjective smooth map  $\pi : X \rightarrow M$  of smooth manifolds is a *locally trivial fibration* if there is an open cover  $\mathcal{U}$  of  $M$  and diffeomorphisms  $\varphi_U : \pi^{-1}(U) \rightarrow U \times \pi^{-1}(p_U)$ , with  $p_U \in U$ , such that  $\varphi_U$  is fiber-preserving, that is  $p_1 \varphi_U = \pi$ . We denote  $\pi^{-1}(p)$  by  $F_p$ .

## Locally trivial Fibrations

### Definition

A surjective smooth map  $\pi : X \rightarrow M$  of smooth manifolds is a *locally trivial fibration* if there is an open cover  $\mathcal{U}$  of  $M$  and diffeomorphisms  $\varphi_U : \pi^{-1}(U) \rightarrow U \times \pi^{-1}(p_U)$ , with  $p_U \in U$ , such that  $\varphi_U$  is fiber-preserving, that is  $p_1 \varphi_U = \pi$ . We denote  $\pi^{-1}(p)$  by  $F_p$ .

Consider  $\pi : X \rightarrow M$  a locally trivial fibration and  $s : M \rightarrow X$  a *section*. There is an action of  $\pi_1(M, p)$  on  $\pi_1(F_p, x_0)$  ( $s(p) = x_0$ ) called *monodromy action of  $M$  on  $F_p$* .

## Monodromy Actions

$$\pi^{-1}(\gamma) = \begin{array}{ccc} \tilde{X} & \hookrightarrow & X \\ \downarrow \tilde{\pi} & & \downarrow \pi \\ I & \xrightarrow{\gamma} & M \end{array}$$

## Monodromy Actions

$$\begin{array}{ccc} \pi^{-1}(\gamma) = \tilde{X} & \hookrightarrow & X \\ \downarrow \tilde{\pi} & & \downarrow \pi \\ I & \xrightarrow{\gamma} & M \end{array}$$

The fibration  $\tilde{\pi}$  is trivial, and hence there exists

$$\varphi : I \times F_p \rightarrow \tilde{X}$$

such that  $\varphi(0, x) = Id_{F_p}$ .

If  $\pi$  is such that  $F_p$  is connected, then given a loop  $\alpha \in \pi_1(F_p, x_0)$  and a loop  $\gamma \in \pi_1(M, p)$ , then one deforms  $\varphi(t, \alpha)$  into a loop  $\alpha_t \in \Gamma(F_{\gamma(t)}, s(\gamma(t)))$ . Then  $\alpha^\gamma := \alpha_1$  is the monodromy action of  $\gamma$  over  $\alpha$ .

Remark

Another interesting scenario occurs when  $F_p$  is finite and  $\pi$  is a topological cover. In that case  $\varphi(1, x)$  induces a permutation of  $F_p$ . This permutation is also called the *monodromy action of  $\gamma$  over  $F_p$* .

## Examples

### Example

Let  $\pi : X = M \times F \rightarrow M$  be a trivial fibration. Any continuous map  $\omega : M \rightarrow F$ , defines  $s(x) = (x, \omega(x))$  a section of  $\pi : X \rightarrow M$ . In this case,  $\varphi$  is the identity. Let  $\gamma \in \pi_1(M, p)$  and  $\alpha \in \pi_1(F, x_0)$ , then  $\alpha_t$  is given by  $(\omega_t \circ \gamma)^{-1} \alpha (\omega_t \circ \gamma)$ , where  $\omega_t \circ \gamma(\lambda) = \omega(\gamma(\lambda t))$ . Therefore  $\pi_1(M, p)$  acts on  $\pi_1(F, \omega(p))$  by

$$\alpha^\gamma = (\omega \circ \gamma)^{-1} \alpha (\omega \circ \gamma).$$

## Examples

### Example

Let  $\pi : X = M \times F \rightarrow M$  be a trivial fibration. Any continuous map  $\omega : M \rightarrow F$ , defines  $s(x) = (x, \omega(x))$  a section of  $\pi : X \rightarrow M$ . In this case,  $\varphi$  is the identity. Let  $\gamma \in \pi_1(M, p)$  and  $\alpha \in \pi_1(F, x_0)$ , then  $\alpha_t$  is given by  $(\omega_t \circ \gamma)^{-1} \alpha (\omega_t \circ \gamma)$ , where  $\omega_t \circ \gamma(\lambda) = \omega(\gamma(\lambda t))$ . Therefore  $\pi_1(M, p)$  acts on  $\pi_1(F, \omega(p))$  by

$$\alpha^\gamma = (\omega \circ \gamma)^{-1} \alpha (\omega \circ \gamma).$$

## Examples

### Example

Let  $\pi : X = M \times F \rightarrow M$  be a trivial fibration. Any continuous map  $\omega : M \rightarrow F$ , defines  $s(x) = (x, \omega(x))$  a section of  $\pi : X \rightarrow M$ . In this case,  $\varphi$  is the identity. Let  $\gamma \in \pi_1(M, p)$  and  $\alpha \in \pi_1(F, x_0)$ , then  $\alpha_t$  is given by  $(\omega_t \circ \gamma)^{-1} \alpha (\omega_t \circ \gamma)$ , where  $\omega_t \circ \gamma(\lambda) = \omega(\gamma(\lambda t))$ . Therefore  $\pi_1(M, p)$  acts on  $\pi_1(F, \omega(p))$  by

$$\alpha^\gamma = (\omega \circ \gamma)^{-1} \alpha (\omega \circ \gamma).$$

## Examples

### Example

Let  $\pi : X = M \times F \rightarrow M$  be a trivial fibration. Any continuous map  $\omega : M \rightarrow F$ , defines  $s(x) = (x, \omega(x))$  a section of  $\pi : X \rightarrow M$ . In this case,  $\varphi$  is the identity. Let  $\gamma \in \pi_1(M, p)$  and  $\alpha \in \pi_1(F, x_0)$ , then  $\alpha_t$  is given by  $(\omega_t \circ \gamma)^{-1} \alpha (\omega_t \circ \gamma)$ , where  $\omega_t \circ \gamma(\lambda) = \omega(\gamma(\lambda t))$ . Therefore  $\pi_1(M, p)$  acts on  $\pi_1(F, \omega(p))$  by

$$\alpha^\gamma = (\omega \circ \gamma)^{-1} \alpha (\omega \circ \gamma).$$

## Examples

### Example

Let  $\pi : X = M \times F \rightarrow M$  be a trivial fibration. Any continuous map  $\omega : M \rightarrow F$ , defines  $s(x) = (x, \omega(x))$  a section of  $\pi : X \rightarrow M$ . In this case,  $\varphi$  is the identity. Let  $\gamma \in \pi_1(M, p)$  and  $\alpha \in \pi_1(F, x_0)$ , then  $\alpha_t$  is given by  $(\omega_t \circ \gamma)^{-1} \alpha (\omega_t \circ \gamma)$ , where  $\omega_t \circ \gamma(\lambda) = \omega(\gamma(\lambda t))$ . Therefore  $\pi_1(M, p)$  acts on  $\pi_1(F, \omega(p))$  by

$$\alpha^\gamma = (\omega \circ \gamma)^{-1} \alpha (\omega \circ \gamma).$$

## Examples

### Example

Let  $\pi : X = M \times F \rightarrow M$  be a trivial fibration. Any continuous map  $\omega : M \rightarrow F$ , defines  $s(x) = (x, \omega(x))$  a section of  $\pi : X \rightarrow M$ . Therefore  $\pi_1(M, p)$  acts on  $\pi_1(F, \omega(p))$  by

$$\alpha^\gamma = (\omega \circ \gamma)^{-1} \alpha (\omega \circ \gamma).$$

$$\alpha_1^\gamma = (\alpha_2 \alpha_1)^{-1} \alpha_1 (\alpha_2 \alpha_1)$$

$$\alpha_2^\gamma = \alpha_1^{-1} \alpha_2 \alpha_1$$

## Examples

### Example

Consider  $F$  as before, but now  $X$  is not trivial. The trivialization along  $\gamma$  is not the identity, but given as follows:

## Examples

### Example

Consider  $F$  as before, but now  $X$  is not trivial. The trivialization along  $\gamma$  is not the identity, but given as follows:

## Examples

### Example

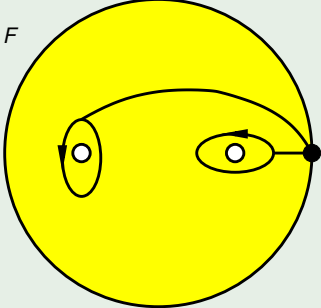

Consider  $F$  as before, but now  $X$  is not trivial. The trivialization along  $\gamma$  is not the identity, but given as follows:

## Examples

**Example**

Consider  $F$  as before, but now  $X$  is not trivial. The trivialization along  $\gamma$  is not the identity, but given as follows:

The diagram shows a yellow circle labeled  $F$ . Inside the circle, there are two small white ovals, each containing a black dot. A black path, labeled  $\gamma$ , starts at the rightmost dot, moves right, then curves upwards and left, then downwards and left, ending at the leftmost dot. Arrows on the path indicate a counter-clockwise direction.

## Examples

### Example

Consider  $F$  as before, but now  $X$  is not trivial. The trivialization along  $\gamma$  is not the identity, but given as follows:

## Examples

### Example

Consider  $F$  as before, but now  $X$  is not trivial. The trivialization along  $\gamma$  is not the identity, but given as follows:

$$\alpha_1^\gamma = \alpha_2$$
$$\alpha_2^\gamma = \alpha_2 \alpha_1 \alpha_2^{-1}$$

## Mapping Class Group

### Theorem

*There is an isomorphism between the geometric group of braids on  $n$ -strings and the mapping class group of automorphisms on the punctured disc  $\mathbb{D}_n := \mathbb{D} \setminus Z_n$  modulo homotopy relative to the boundary, that is,  $\pi_0(\text{Diff}^+(X_n))$ .*

## Braid Action

### Remarks

- The set  $\pi_0(\text{Diff}^+(X_n))$  is naturally in bijection with the set of trivializations along  $I$  of locally trivial fibrations of fiber  $\mathbb{D}_n$ .

## Braid Action

### Remarks

- The set  $\pi_0(\text{Diff}^+(X_n))$  is naturally in bijection with the set of trivializations along  $I$  of locally trivial fibrations of fiber  $\mathbb{D}_n$ .
- This way, via monodromy, a braid in  $\mathbb{B}_n$  acts on  $\pi_1(\mathbb{D}_n) = F_n = \mathbb{Z}g_1 * \dots * \mathbb{Z}g_n$  as follows (▶):

$$g_j^{\sigma_i} = \begin{cases} g_{i+1} & j = i \\ g_{i+1}g_i g_{i+1}^{-1} & j = i + 1 \\ g_j & \text{otherwise.} \end{cases}$$

## Braid Action

### Remarks

- The set  $\pi_0(\text{Diff}^+(X_n))$  is naturally in bijection with the set of trivializations along  $I$  of locally trivial fibrations of fiber  $\mathbb{D}_n$ .
- This way, via monodromy, a braid in  $\mathbb{B}_n$  acts on  $\pi_1(\mathbb{D}_n) = F_n = \mathbb{Z}g_1 * \dots * \mathbb{Z}g_n$  as follows (▶):

$$g_j^{\sigma_i} = \begin{cases} g_{i+1} & j = i \\ g_{i+1}g_i g_{i+1}^{-1} & j = i + 1 \\ g_j & \text{otherwise.} \end{cases}$$

- Since  $(g_n \cdot \dots \cdot g_1) = \partial\mathbb{D}$ , one obtains  $(g_n \cdot \dots \cdot g_1)^\sigma = (g_n \cdot \dots \cdot g_1)$ .

## Definition

### Definition

Let  $M$  be an  $m$ -dimensional (connected) complex manifold. A *branched covering* of  $M$  is an  $m$ -dimensional irreducible normal complex space  $X$  together with a surjective holomorphic map  $\pi : X \rightarrow M$  such that:

- every fiber of  $\pi$  is discrete in  $X$ ,

## Definition

### Definition

Let  $M$  be an  $m$ -dimensional (connected) complex manifold. A *branched covering* of  $M$  is an  $m$ -dimensional irreducible normal complex space  $X$  together with a surjective holomorphic map  $\pi : X \rightarrow M$  such that:

- every fiber of  $\pi$  is discrete in  $X$ ,
- $R_\pi := \{q \in X \mid \pi^* : \mathcal{O}_{\pi(q),M} \rightarrow \mathcal{O}_{q,X} \text{ is not an isomorphism}\}$  called the *ramification locus*, and  $B_\pi = \pi(R_\pi)$  called the *branched locus*, are hypersurfaces of  $X$  and  $M$ , resp.

## Definition

### Definition

Let  $M$  be an  $m$ -dimensional (connected) complex manifold. A *branched covering* of  $M$  is an  $m$ -dimensional irreducible normal complex space  $X$  together with a surjective holomorphic map  $\pi : X \rightarrow M$  such that:

- every fiber of  $\pi$  is discrete in  $X$ ,
- $R_\pi := \{q \in X \mid \pi^* : \mathcal{O}_{\pi(q),M} \rightarrow \mathcal{O}_{q,X} \text{ is not an isomorphism}\}$  called the *ramification locus*, and  $B_\pi = \pi(R_\pi)$  called the *branched locus*, are hypersurfaces of  $X$  and  $M$ , resp.
- $\pi| : X \setminus \pi^{-1}(B_\pi) \rightarrow M \setminus B_\pi$  is an unramified (topological) covering, and

  - i)  $\pi^{-1}(p) \cap U = \{q\}$
  - ii)  $\pi|_U : U \rightarrow W$  is surjective and proper.

## Construction of branched coverings: smooth case

If  $B$  is a non-singular hypersurface,  $B = D_1 \cup \dots \cup D_n$ ,  $e_1, \dots, e_n \in \mathbb{N}$ ,  $D = \sum e_i D_i$  on  $M$ .  
 $p_0 \in M \setminus B$  base point.

## Construction of branched coverings: smooth case

If  $B$  is a non-singular hypersurface,  $B = D_1 \cup \dots \cup D_n$ ,  $e_1, \dots, e_n \in \mathbb{N}$ ,  $D = \sum e_i D_i$  on  $M$ .  
 $p_0 \in M \setminus B$  base point. Let  $J = N(\gamma_1^{e_1}, \dots, \gamma_n^{e_n}) \triangleleft \pi_1(M \setminus B, p_0)$ .

## Construction of branched coverings: smooth case

If  $B$  is a non-singular hypersurface,  $B = D_1 \cup \dots \cup D_n$ ,  $e_1, \dots, e_n \in \mathbb{N}$ ,  $D = \sum e_i D_i$  on  $M$ .  
 $p_0 \in M \setminus B$  base point. Let  $J = N(\gamma_1^{e_1}, \dots, \gamma_n^{e_n}) \triangleleft \pi_1(M \setminus B, p_0)$ .  $G := \pi_1(M \setminus B, p_0) / J$ .

## Construction of branched coverings: smooth case

If  $B$  is a non-singular hypersurface,  $B = D_1 \cup \dots \cup D_n$ ,  $e_1, \dots, e_n \in \mathbb{N}$ ,  $D = \sum e_i D_i$  on  $M$ .  $p_0 \in M \setminus B$  base point. Let  $J = N(\gamma_1^{e_1}, \dots, \gamma_n^{e_n}) \triangleleft \pi_1(M \setminus B, p_0)$ .  $G := \pi_1(M \setminus B, p_0)/J$ .

### Condition

If  $\gamma_j^d \in J$  then  $d \equiv 0 \pmod{e_j} \forall 1 \leq j \leq s$ .

### Theorem

There is a natural one-to-one correspondence between

$$\begin{array}{c} \{\pi : X \rightarrow M \text{ Galois, finite, ramified along } D\} / \sim \\ \uparrow \\ \{J \subset K \triangleleft \pi_1(M \setminus B) \text{ satisfying (1.4)}\} \end{array}$$

Moreover, there is a maximal Galois covering  $\pi(M, D)$  of  $M$  ramified along  $D$  iff  $K_\pi = \cap K \triangleleft \pi_1(M \setminus B)$  satisfies (1.4).

## Construction of branched coverings: smooth case

### Theorem (Riemann Existence Theorem)

*Any monodromy action  $\pi_1(\mathbb{P}^1 \setminus Z_n) \rightarrow \Sigma_s$  can be realized by a branched covering of the projective line  $\mathbb{P}^1$ .*

## Construction of branched coverings: general case

If  $B$  is a hypersurface,  $B = D_1 \cup \dots \cup D_n$ ,  $e_1, \dots, e_n \in \mathbb{N}$ ,  $D = \sum e_i D_i$  on  $M$ .  $p_0 \in M \setminus B$  base point.

## Construction of branched coverings: general case

If  $B$  is a hypersurface,  $B = D_1 \cup \dots \cup D_n$ ,  $e_1, \dots, e_n \in \mathbb{N}$ ,  $D = \sum e_i D_i$  on  $M$ .  $p_0 \in M \setminus B$  base point. Let  $K = \pi_* (\pi_1(X \setminus \pi^{-1}(B), q_0))$ ,  $q_0 \in \pi^{-1}(p_0)$ ,  $p \in \text{Sing } B$ .

## Construction of branched coverings: general case

base point. Let  $K = \pi_*(\pi_1(X \setminus \pi^{-1}(B), q_0))$ ,  $q_0 \in \pi^{-1}(p_0)$ ,  $p \in \text{Sing } B$ .  
 $i: W^{p_0} \setminus B \hookrightarrow M \setminus B$ .

## Construction of branched coverings: general case

If  $B$  is a hypersurface,  $B = D_1 \cup \dots \cup D_n$ ,  $e_1, \dots, e_n \in \mathbb{N}$ ,  $D = \sum e_i D_i$  on  $M$ .  $p_0 \in M \setminus B$  base point. Let  $K = \pi_* (\pi_1(X \setminus \pi^{-1}(B), q_0))$ ,  $q_0 \in \pi^{-1}(p_0)$ ,  $p \in \text{Sing } B$ .  
 $i: W^{p_0} \setminus B \hookrightarrow M \setminus B$ .

### Condition

Let  $K \triangleleft \pi_1(M \setminus B, p_0)$  such that  $J \triangleleft K$ . For any point  $p \in \text{Sing } B$ ,  
 $K_p = i_*^{-1}(K) \triangleleft \pi_1(W \setminus B, \tilde{p})$ .

### Theorem

There is a one-to-one correspondence:

$$\begin{array}{c} \{\pi : X \rightarrow M \text{ Galois, finite, ramified along } D\} / \sim \\ \uparrow \\ \{J \subset K \triangleleft \pi_1(M \setminus B) \text{ satisfying (1.4) and (1.7)}\}. \end{array}$$

Moreover, there is a maximal Galois covering  $\pi(M, D)$  of  $M$  ramified along  $D$  iff  
 $K_\pi = \bigcap K \triangleleft \pi_1(M \setminus B)$  satisfies (1.4) and (1.7).

### Example

Consider  $M = \mathbb{P}^2$ ,  $D_1 = \{zy^2 = x^3\}$ ,  $D_2 = \{z = 0\}$ . Let us study the possible Galois covers of  $\mathbb{P}^2$  ramified along  $D = e_1 D_1 + e_2 D_2$ .

### Example

Consider  $M = \mathbb{P}^2$ ,  $D_1 = \{zy^2 = x^3\}$ ,  $D_2 = \{z = 0\}$ . Let us study the possible Galois covers of  $\mathbb{P}^2$  ramified along  $D = e_1 D_1 + e_2 D_2$ .

Figure:  $y^2 = x^3$

### Example

Consider  $M = \mathbb{P}^2$ ,  $D_1 = \{zy^2 = x^3\}$ ,  $D_2 = \{z = 0\}$ . Let us study the possible Galois covers of  $\mathbb{P}^2$  ramified along  $D = e_1 D_1 + e_2 D_2$ .

Figure:  $y^2 = (x - y)^3$

Example

Consider  $M = \mathbb{P}^2$ ,  $D_1 = \{zy^2 = x^3\}$ ,  $D_2 = \{z = 0\}$ . Let us study the possible Galois covers of  $\mathbb{P}^2$  ramified along  $D = e_1 D_1 + e_2 D_2$ .

Figure:  $y^2 = (x - y)^3$

Example

Consider  $M = \mathbb{P}^2$ ,  $D_1 = \{zy^2 = x^3\}$ ,  $D_2 = \{z = 0\}$ . Let us study the possible Galois covers of  $\mathbb{P}^2$  ramified along  $D = e_1 D_1 + e_2 D_2$ .

Figure:  $y^2 = (x - y)^3$

Example

Consider  $M = \mathbb{P}^2$ ,  $D_1 = \{zy^2 = x^3\}$ ,  $D_2 = \{z = 0\}$ . Let us study the possible Galois covers of  $\mathbb{P}^2$  ramified along  $D = e_1 D_1 + e_2 D_2$ .

$$\tilde{\gamma}_\infty \tilde{\gamma}_2 \gamma_2 \gamma_1 = 1,$$

Example

Consider  $M = \mathbb{P}^2$ ,  $D_1 = \{zy^2 = x^3\}$ ,  $D_2 = \{z = 0\}$ . Let us study the possible Galois covers of  $\mathbb{P}^2$  ramified along  $D = e_1 D_1 + e_2 D_2$ .

$$\tilde{\gamma}_\infty \tilde{\gamma}_2 \gamma_2 \gamma_1 = 1,$$
$$\tilde{\gamma}_2 = \gamma_2.$$

Example

Consider  $M = \mathbb{P}^2$ ,  $D_1 = \{zy^2 = x^3\}$ ,  $D_2 = \{z = 0\}$ . Let us study the possible Galois covers of  $\mathbb{P}^2$  ramified along  $D = e_1 D_1 + e_2 D_2$ .

$$\begin{aligned}\tilde{\gamma}_\infty \tilde{\gamma}_2 \gamma_2 \gamma_1 &= 1, \\ \tilde{\gamma}_2 &= \gamma_2, \\ \gamma_2 \gamma_1 \gamma_2 &= \gamma_1 \gamma_2 \gamma_1.\end{aligned}$$

### Theorem

In the following cases there is a maximal Galois covering of  $\mathbb{P}^2$  ramified along  $D$ :

$(e_1, e_2)$	$G = \pi_1(\mathbb{P}^2 \setminus D)/J$	$ G $
(2, 2)	$\Sigma_3$	6
(3, 4)	$SL(2, \mathbb{Z}/3\mathbb{Z})$	24
(4, 8)	$\Sigma_4 \times \mathbb{Z}/4\mathbb{Z}$	96
(5, 20)	$SL(2, \mathbb{Z}/5\mathbb{Z}) \times \mathbb{Z}/5\mathbb{Z}$	600

### Theorem

In the following cases there is a maximal Galois covering of  $\mathbb{P}^2$  ramified along  $D$ :

$(e_1, e_2)$	$G = \pi_1(\mathbb{P}^2 \setminus D)/J$	$ G $
(2, 2)	$\Sigma_3$	6
(3, 4)	$SL(2, \mathbb{Z}/3\mathbb{Z})$	24
(4, 8)	$\Sigma_4 \times \mathbb{Z}/4\mathbb{Z}$	96
(5, 20)	$SL(2, \mathbb{Z}/5\mathbb{Z}) \times \mathbb{Z}/5\mathbb{Z}$	600

However, there is no maximal Galois cover of  $\mathbb{P}^2$  ramified along  $D = 6D_1 + 2D_2$ .

### Theorem

Let  $B = D_1 \cup \dots \cup D_n$ . Then any representation of  $\pi_1(M \setminus B)$  on a linear group  $GL(r, \mathbb{C})$  such that the image of a meridian  $\gamma_i$  has order  $e_i$ , gives rise to a Galois cover of  $M$  branched along  $D = e_1 D_1 + \dots + e_n D_n$ .

- How to compute the fundamental group  $\pi_1(M \setminus B)$  of a quasi-projective variety?

**Theorem (Hamm, Goreski-MacPherson)**

Let  $M \subset \mathbb{P}^n$  be a closed subvariety which is locally a complete intersection of dimension  $m$ . Let  $\mathcal{A}$  be a *Whitney stratification* of  $M$  and consider  $B \subset \mathbb{P}^n$  another subvariety such that  $B \cap M$  is a union of strata of  $\mathcal{A}$ . Consider  $H$  a hyperplane transversal to  $\mathcal{A}$  in  $M \setminus B$ , then the inclusion

$$(M \setminus B) \cap H \hookrightarrow M \setminus B$$

is an  $(m - 1)$ -homotopy equivalence.
